AI-Assisted Community Health Kiosk

TeamDiamonds • Shrinkhala Anand • Vaidik Gupta

The problem

Patient intake can be fragmented or repetitive. Language and accessibility friction may make it harder to captur

Opportunity: structure the first step of a consultation without replacing qualified healthcare staff.

Our solution

A guided kiosk journey: patient access → profile → symptoms → demo vitals → assessment → printable visit s

Friendly female-doctor visual, clear feature tiles, and privacy/safety messaging create a welcoming starting point.

Healthcare use case

A patient at a community health centre enters symptoms and basic information before a consultation.

Staff can review the structured intake and visit history. This is an intended workflow benefit, not a measured clinical outcome.

System architecture

HTML/CSS/JavaScript frontend → FastAPI REST API → Pydantic validation → SQLite persistence.

The API calls a prototype symptom-pattern model and separate rule-based safety checks. Staff dashboard reads records via the API.

AI / ML approach

Python + scikit-learn workflow; prototype datasets and a locally saved model are included in the repository.

Output is exploratory pattern matching only. Included data are not a representative clinical cohort and are not evidence of clinical accuracy.

Demo walkthrough

1. Welcome/login or guest flow 2. Registration and age 3. Select symptoms 4. Review demo vitals 5. Submit a

6. View safety flags and result 7. Print summary 8. Staff dashboard 9. API docs and project architecture

Limitations & next steps

OTP and device readings may be simulated. The project is not clinically validated and does not diagnose or pre

Next: finish integration testing, localisation/accessibility checks, secure staff authentication, device validation, and expert clinical/privacy review.

Submission & links

README.md contains setup, API endpoints, team details, architecture, AI/ML notes, and the safety boundary.

Replace the demo-video placeholder with a real 15–20 minute unlisted YouTube URL before submission.
